The Audience Response System (ARS), better known as “clickers”, have been used widely in education and have been proven to enhance learning in several areas. Research shows that the ARS results in increased discussion between the presenter and the learners, and also increased scores on tests.

This session will utilize the ARS with the presentation of four case studies on challenging pediatric surgery topics. In order to gain full benefit of the ARS, none of the information on the case studies will be available to the audience prior to the session. After the conference however, all the case presentations will be accessible on the APSNA website. Thank you for your participation in this session, a first for APSNA!
