Changing Practice to Reduce Diabetes Complications

Kidney Disease

Diabetes can lead to costly and debilitating complications such as kidney disease.

- Improving blood pressure and blood glucose control in people with diabetes reduces the risk for kidney disease by up to 40%. (CDC, 2011)
- Treatment with angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) is more effective in reducing the decline in kidney function than treatment with other blood pressure lowering drugs. (CDC, 2011)

Changing health systems and provider practices benefits people with diabetes:

- Interventions based on the Chronic Care Model (see below) improved at least 1 process or outcome measure for people with diabetes in primary care practices. (Bodenheimer, 2012)
- Use of electronic health records (EHRs) led to higher achievement of care & outcome standards for patients with diabetes than use of paper records, including meeting blood pressure and LDL-cholesterol goals. (Cebul, 2011)
- Achieving NCQA patient-centered medical home recognition led to significant improvement in the percentage of patients with diabetes who had evidence-based complications screening. (Gabbay, 2011)
- Involvement of non-physician providers such as pharmacists, case managers, and community health workers is strongly supported as a way to improve diabetes outcomes. (NIH, 2011)

Diabetes and Kidney Disease

Diabetes is associated with reduced quality of life, especially for people with multiple and/or severe complications.

- Medicare recipients with diabetes and kidney disease account for over 13% of Medicare expenditures although they are only 4% of the total Medicare population (2008). (Foley, 2009)

Chronic Care Model Components (www.improvingchroniccare.org)

- Health care organization
- Self-management support
- Delivery system design
- Decision support
- Clinical information systems
- Community resources and policies

The Chronic Care Model is an effective framework for practice redesign.
How Can Providers Assure Quality Care Related to Major Complications for People with Diabetes?

- Assess A1C 2 to 4 times a year
- Assess and control blood pressure and blood lipids
- Consider self-monitoring for blood pressure, especially for those with poorly controlled hypertension.
- Assure receipt of annual dilated eye exams and foot exams, appropriate immunizations and other preventive services
- Assess weight; recommend physical activity, healthy diet and medical nutrition therapy as appropriate
- Review, adjust and/or administer medications
- Promote self-management training
- Assess smoking status and advise smokers to quit
- Provide psychosocial assessment; refer to a mental health specialist familiar with diabetes, as appropriate
- Assess urine albumin & albumin/creatinine ratio (ACR) and estimated glomerular filtration rate (eGFR) annually
