Bipolar Disorder for the Non-Psychiatric Physician
Learning Objectives:

1. The physician will be able to recognize/distinguish bipolar/manic symptoms from other symptoms of mental illness.
2. The physician will be able to initiate treatment and monitor for complications.
3. The physician will be able to avoid pitfalls for treatment of general medical conditions to prevent a manic episode from occurring in individuals susceptible to a manic episode.
What is Bipolar Disorder?

A severe mental illness characterized by symptoms of at least one manic or hypomanic episode and may or may not be associated with having a depressive episode in a person’s lifetime. It is cyclical in nature and progressive.
Bipolar and Related Disorders

The Diagnostic and Statistical Manual of Mental Disorders has sandwiched Bipolar related disorders between the Schizophrenia Spectrum disorders and Depressive disorders to recognize the relationship between these disorders.
The Big Three

For today’s purposes, we are going to focus on Bipolar I and Bipolar II disorder with mention of Cyclothymia.
What is the difference?

In a nutshell, to meet criteria for Bipolar I disorder, your patient has had to have met the criteria for at least one Manic episode in his or her lifetime. That episode should have been severe enough to warrant hospitalization or to cause significant impairment in functioning (this can include incarceration).
What is the difference?

In the Bipolar II patient, you must have met criteria for a hypomanic episode, and while impairment in level of functioning is impaired, it is less severe than that of the Bipolar I patient. In addition, the Bipolar II patient has had to have had a depressive episode in his or her lifetime.
What is the difference?

In the Cyclothymic patient, he or she has experienced manic episodes without ever having had a depressive episode.
What is Mania?

Manic vs. Hypomanic

The difference between the two are time and severity. For the “A” criteria of a manic episode, the symptoms last at least a week or hospitalization is necessary.
Manic vs. Hypomanic

For the “A” criteria in the hypomanic episode, the symptoms last at least four consecutive days, change in functioning is noticeable by others, but not severe enough to cause major impairments.
The “A” Criteria

The patient has a “distinct period and persistently elevated, expansive, or irritable mood AND persistently increased goal-directed activity or energy”
What does that look like?

Elevated and Expansive

Irritable
Children and Adolescents

Irritable and destructive

Depressive episode tends to have physical complaints.
Goal-Directed Activity

Taking on of more new projects or commitments than normally, because pesky things like sleep or common sense would stand in his or her way.
The “B” Criteria

During this episode of abnormal mood and activity/energy, one must also have at least three (four if mood is only irritable) of the following seven criteria.
1. Self-Esteem

The self-esteem is inflated or grandiose.

They can be benign expansions of the truth or floridly reaching delusional levels.
Example of inflated self-esteem:
2. Decreased Need for Sleep

Feels rested after only a few hours
3. Speech
More talkative than usual
or
pressured to keep talking.
Warning: What is cultural?
4. Flight of Ideas
Racing Thoughts

The Patient’s train of thought is characterized by shifting from one topic to another. There may be some connection between ideas, albeit tenuous, but may be understandable. When moderate to severe, it can be elevated to illogical.
What does that look like?

“The sky is blue. Blue is my favorite color. My mom took me to Color-Me-Mine once. I painted a mug. Don’t drive through Los Angeles; you’ll get mugged.”
What does it look like?

Patient: I came to see you to the psychiatrist’s office because you have the time to listen to me GPs don’t have the time to listen to me because he’s not very clever he takes some interest in me sometimes but sometimes he doesn’t I’ve got real important stuff to show you because there is real important stuff here.

Psychiatrist: What is your name?
Patient: Names? Names are games, diddley dang whatsyourname? (laughing)
What does it look like?

Often times the patient may tell you that his or her thoughts are racing and like the previous example, that is evident. Sometimes the patients thoughts are so rapid that he or she can’t keep up with the thoughts and may have trouble himself being able to express any thoughts.
5. Distractibility

Attention is too easily drawn to unimportant or irrelevant external stimuli.
6. Increase in Goal Directed Activity/Energy

If the patient is only experiencing a hypomanic episode, this can be advantageous to his or her career.
6. or Psychomotor agitation

Purposeless non-goal-directed activity. It can also be manifested by pacing, hand wringing or picking at the patient’s nails, hair, etc.
7. Excessive involvement in activities that have a high potential for painful consequences
Engaging in unrestrained buying sprees
Sexual Indiscretions
Foolish Business Investments
Test Film

Test Question

1. In the film, Good Morning Vietnam, in this scene, Robin Williams’ character demonstrates which of the following manic symptoms?
   a. racing thoughts
   b. pressured speech
   c. elevated and expansive mood
   d. All of the above
What it isn’t

Not secondary to a substance.

Not due to a general medical condition.

It is not better explained by another major psychiatric disorder.
Is it mania? or is it meth?

Methamphetamines, amphetamines, cocaine, and PCP can all give manic like presentations.
Prescription Medications that Induce Manic Symptoms

All Antidepressant medications have been implicated in inducing manic-like or manic episodes. 2,3 L-Dopa, Corticosteroids, Anabolic-androgenic steroids 2 Tramadol 4 Isoniazide 5 Clarithromycin, Ciprofloxacin and Ofloxacin among other antimicrobials 5
Thyroid Induced Mania

Either by supplementation or by Grave’s Disease itself can induce a manic-like episode or exacerbate mania. 6,7.
Borderline Personality Disorder

“Mood Swings” is NOT bipolar disorder.

If her mood is like the weather and not the season, she could be a borderline.
Demi Lovato on Her Bipolar Disorder: “It's a Daily Thing”
Lovato tells *Cosmopolitan for Latinas*, which named her its "Fun, Fearless Latina of the Year."
At 21, Lovato has overcome many hurdles – including an eating disorder, drug abuse, self-mutilation, rehab and a nervous breakdown – but the pop singer remains open about her struggles, hoping to inspire others, especially young people. 9
Diagnostic criteria for 301.83 Borderline Personality Disorder

A pervasive pattern of instability of interpersonal relationships, self-image, and affects, and marked impulsivity beginning by early adulthood and present in a variety of contexts, as indicated by five (or more) of the following:

(1) frantic efforts to avoid real or imagined abandonment.  **Note:** Do not include suicidal or self-mutilating behavior covered in Criterion 5.
(2) a pattern of unstable and intense interpersonal relationships characterized by alternating between extremes of idealization and devaluation
(3) identity disturbance: markedly and persistently unstable self-image or sense of self
(4) impulsivity in at least two areas that are potentially self-damaging (e.g., spending, sex, substance abuse, reckless driving, binge eating).  **Note:** Do not include suicidal or self-mutilating behavior covered in Criterion 5.
(5) recurrent suicidal behavior, gestures, or threats, or self-mutilating behavior
(6) affective instability due to a marked reactivity of mood (e.g., intense episodic dysphoria, irritability, or anxiety usually lasting a few hours and only rarely more than a few days)
(7) chronic feelings of emptiness
(8) inappropriate, intense anger or difficulty controlling anger (e.g., frequent displays of temper, constant anger, recurrent physical fights)
(9) transient, stress-related paranoid ideation or severe dissociative symptoms
I hate you, don’t leave me
I feel like I can’t breathe
Just hold me, don’t touch me

And I want you to love me
But I need you to trust me
Stay with me, set me free

But I can’t back down, no, I can’t deny
That I’m staying now ’cause I can’t decide
Confused and scared I am terrified of you

I admit, I’m in and out of my head
Don’t listen to a single word I’ve said
Just hear me out before you run away
‘Cause I can’t take this pain

No
I’m addicted to the madness
I’m a daughter of the sadness
I’ve been here too many times before
I’ve been abandoned and I’m scared now
I can’t handle another fall out
I am fragile, just washed up on the shore

They forget me, don’t see me
When they love me, they leave me

I hate you, don’t leave me
I hate you, don’t leave me
‘Cause I love when you kiss me
I’m in pieces, you complete me

But I can’t back down, no, I can’t deny
That I’m staying now ’cause I can’t decide
Confused and scared I am terrified of you

I admit, I’m in and out of my head
Don’t listen to a single word I’ve said
Just hear me out before you run away
‘Cause I can’t take this pain

No, I can’t take this pain
I hate you, don’t leave me
I hate you, please, love me
I HATE YOU—DON'T LEAVE ME
